

How big is quick commerce in Mysuru and Mangaluru?

Three ways to size it.

One range they all support.

A desk-based estimate from public data. Bottom-up from households, cross-checked from the supply side and against the national total. Every assumption is labelled so it can be tested in primary research.

Mysuru and Mangaluru are a ₹120 to 180 crore a year market

~₹150 crore

Working estimate, annualised GOV, both cities
(2026)

39

Dark stores mapped: Mysuru 31, Mangaluru 8 (July
2026)

~₹650

Spend per resident per year at the working
estimate

Three independent methods overlap at roughly ₹120 to 180 crore: households (₹46 to 230 crore), store productivity (₹118 to 294 crore) and share of the national total (₹89 to 177 crore).

To land on ₹150 crore, about 18% of online households need to order each month. The base case assumes 14%, so that share is the number to test first.

On the national pace of growth forecast to FY28, the two cities could reach ₹185 to 220 crore. Half of that pace is the cautious case.

Define the market before sizing it

Question

What is the yearly value of quick commerce (10 to 30 minute delivery from local dark stores) in India's two Karnataka tier-2 markets, one with deep dark-store coverage (Mysuru) and one with thin coverage (Mangaluru)?

Definition

Orders placed on Blinkit, Zepto, Swiggy Instamart, Flipkart Minutes and BigBasket. Measured as annualised GOV in rupees, at 2026 run-rate. Groceries and general merchandise from these apps both count.

Scope

Mysuru (about 1.4 million people) and Mangaluru (about 0.9 million), city limits as mapped by the store locator. Out of scope: food delivery, e-commerce with next-day delivery, kirana WhatsApp orders.

Three methods that fail in different ways

1. Demand side (bottom-up)

Households × online share × monthly active share × orders per month × order value.

Weak spot: active share is an assumption.

2. Supply side

Dark stores × daily order value per store × tier-2 productivity factor × 365.

Weak spot: tier-2 stores sell less than metro stores, by an unknown amount.

3. Share of national total

National GOV × the two cities' share of mapped dark stores × a productivity haircut.

Weak spot: national figure is FY25, stores are July 2026.

If the three ranges overlap, the overlap is the estimate. If they do not, the gap shows where primary research is needed.

Quick commerce is large, fast-growing and still metro-heavy

₹64,000 crore

National GOV in FY25, up 142% a year from FY22

5,625

Dark stores mapped across 408 cities

₹518

Blinkit net average order value, Q1 FY27

31.8 mn

Blinkit average monthly transacting customers, Q1 FY27

The top 20 cities hold about two-thirds of mapped stores. The other 388 cities average about five stores each. Karnataka has 725 mapped stores and 87% are in Bengaluru. Mysuru (31) is the only other city with more than 10. Mangaluru has 8.

Order values differ by platform: Zepto about ₹362, Blinkit ₹518, Instamart ₹691 in Q1 FY27. The industry average is about ₹480, which is the base case here.

Ordering frequency for Blinkit is about 3.5 a month, which sets the base case for orders per household.

Mysuru has four times the stores but only 1.5 times the people

Input	Mysuru	Mangaluru	Both	Note
Population (est.)	1.4 mn	0.9 mn	2.3 mn	City estimate, not Census 2011 (Mysuru UA: 0.99 mn)
Households (A1)	350,000	225,000	575,000	Assumes 4.0 persons per household
Dark stores	31	8	39	Lower bound: only publicly visible stores
Stores per million people	22	9	17	Mangaluru is below the 15 per million benchmark
People per store	45,000	113,000	59,000	Each Mangaluru store covers about 2.5 times as many people
Largest platform	Zepto (8 stores)	Blinkit and Instamart (3 each)	-	Zepto is absent from Mangaluru

Households give ₹46 to 230 crore, base case ₹118 crore

Step	Low	Base	High	Basis
Households	575,000	575,000	575,000	A1: population / 4.0
× Online households	70%	75%	80%	A2: urban smartphone and data use
× Monthly active share	8%	14%	20%	A3: the key unknown
= Active households	32,200	60,375	92,000	Calculated
× Orders per month	3.0	3.4	4.0	Blinkit about 3.5 (reported)
× Order value (₹)	400	480	520	Industry about 480 (reported)
= Annual GOV (₹ crore)	46	118	230	Active HH × orders × 12 × value

Two store-based checks both point to ₹120 to 180 crore

Method 2: store productivity

39 stores × ₹8.27 lakh a day × 365 = ₹1,177 crore if every store sold like Blinkit's national average.

Tier-2 stores sell far less. At 10% / 15% / 25% of that level (A4): ₹118 / 177 / 294 crore.

Method 3: share of national total

39 of 5,625 stores is 0.69%. 0.69% of ₹64,000 crore is about ₹444 crore as a ceiling.

At 20% / 30% / 40% of national store productivity (A5): ₹89 / 133 / 177 crore.

Method 3 mixes FY25 national value with July 2026 stores, so it is a rough ceiling and not a point estimate. It is useful because it is independent of the household assumptions.

The three ranges overlap between ₹118 and ₹177 crore

Reading the chart

Highest low case: ₹118 crore (supply side).

Lowest high case: ₹177 crore (share of national).

The demand-side base (₹118 crore) sits at the bottom edge of the overlap, so the active-household share is probably above 14%.

Working estimate: ₹150 crore, the middle of the overlap.

Mangaluru has few stores per head, so store-based methods may understate its demand.

Active household share moves the answer most

Input varied	Low / high value	Result at low (₹ crore)	Result at high (₹ crore)
Monthly active share of online households	8% / 20%	68	169
Orders per active household per month	3.0 / 4.0	104	139
Average order value	₹400 / ₹520	99	128
Online households share	70% / 80%	110	126
Household size	4.4 / 3.6 persons	107	131

Spread is largest for the monthly active share (₹68 to 169 crore), so a short household survey in each city would narrow the range more than any desk work.

Household size and online share matter least. They can stay as desk assumptions.

Both cities could reach ₹185 to 220 crore by FY28

How the cases are built

National GOV grows from ₹64,000 crore (FY25) to about ₹2 lakh crore (FY28): about 46% a year.

Full pace applies that rate for one year to the ₹150 crore base. Half pace applies about 23%.

Tier-2 growth may be faster from a low base or slower if dark stores close. Store counts in both cities should be re-checked each quarter.

What this estimate cannot tell you, and how to close the gap

Limit	Why it matters	How to test
Active share is assumed	Largest swing in the result	Household survey of 300 per city on monthly ordering
Store counts are a lower bound	Locator data misses unlisted stores	Re-map each quarter; check app serviceability by pincode
Tier-2 store productivity unknown	Drives methods 2 and 3	Expert calls with dark-store managers; delivery partner counts
Mixed time periods	FY25 national value, 2026 stores	Replace with FY26 national GOV when published
Population is an estimate	2011 Census is 15 years old	Use the next Census or electricity connection counts
